1:1 →

2026.0
Blue-billed Teal *Spatula hottentota* avibase-FA831F65

2019.1
Eurasian Teal *Anas crecca* avibase-BC6C3CCE

1:1 →

2026.0
Green-winged Teal *Anas crecca* avibase-BC6C3CCE

AviList taxonomy decision

Taxon carolinensis is treated as a subspecies of Anas crecca based on high levels of introgression, coupled with a lack of known differences in courtship vocalization. Although mitochondrial DNA data show a relatively deep divergence between these taxa (Peters et al. 2012), a lack of genomic divergence (McLaughlin et al. 2020; Spaulding et al. 2023) indicates that male-mediated gene flow is extensive.

Galliformes

Guineafowl Numididae

2019.1
Crested Guineafowl *Guttera pucherani* avibase-D5813CA4
Kenya Crested Guineafowl *Guttera pucherani pucherani* avibase-35D60F12
Crested Guineafowl *Guttera (pucherani) verreauxi* avibase-9D29C252

n:n →

2026.0
Eastern Crested Guineafowl *Guttera pucherani* avibase-35D60F12
Western Crested Guineafowl *Guttera verreauxi* avibase-9D29C252

AviList taxonomy decision

Taxa edouardi (polytypic, including barbata) and verreauxi (polytypic) are treated as species separate from Guttera pucherani (monotypic) based on differences in plumage, eye color, and bare parts color. However, further research is needed including investigation of potential hybrid zones and formal bioacoustic analysis. Genetic data would also be informative.

Partridges, Pheasants, Grouse, and Allies Phasianidae

2019.1
Coqui Francolin *Peliperdix coqui* avibase-ECD7C1D8

1:1 →

2026.0
Coqui Francolin *Campocolinus coqui* avibase-ECD7C1D8

2019.1
Elgon Francolin *Scleroptila elgonensis (race theresae)* avibase-3D25568A

1:1 →

2026.0
Elgon Francolin *Scleroptila elgonensis* avibase-3D25568A

AviList taxonomy decision

Taxon elgonensis is treated as a monotypic species separate from Scleroptila psilolaema (monotypic) based on plumage, vocalizations, and genetics (Hunter et al. 2019; Turner et al. 2020).

2019.1
Archer’s Francolin *Scleroptila gutturalis*
avibase-8E833C63

1:1 →

2026.0
Orange River Francolin *Scleroptila gutturalis*
avibase-8E833C63

2019.1
Shelley's Francolin *Scleroptila shelleyi (race macarthuri)* avibase-A15F6836

1:1 →

2026.0
Shelley's Francolin *Scleroptila shelleyi* avibase-A15F6836

AviList taxonomy decision

Taxon whytei is split from Scleroptila shelleyi based on plumage and genetics. Mitochondrial DNA data (Mandiwana-Neudani et al. 2019) indicate species-level divergence between these taxa but intra-generic relationships remain poorly resolved (Mandiwana-Neudani et al. 2019; Kimball et al. 2021).

2019.1
Crested Francolin *Dendroperdix sephaena*
avibase-8004C7E5

1:1 →

2026.0
Crested Francolin *Ortygornis sephaena* avibase-8004C7E5

2019.1
African Blue Quail *Synoicus adansoniee* avibase-CAA45AC6

1:1 →

2026.0
Blue Quail *Synoicus adansonii* avibase-CAA45AC6

2019.1
Common Quail *Coturnix coturnix (race coturnix)*
avibase-CAFE345D

1:1 →

2026.0
Common Quail *Coturnix coturnix* avibase-CAFE345D

2019.1
Chestnut-naped Francolin *Pternistis castaneicollis (race atrifrons)* avibase-81474844

1:1 →

2026.0
Chestnut-naped Spurfowl *Pternistis castaneicollis*
avibase-81474844

AviList taxonomy decision

Taxon atrifrons is treated as conspecific with Pternistis castaneicollis based on available evidence. Divergence in mitochondrial DNA and phenotypic traits (Töpfer et al. 2014) is more consistent with subspecies status in francolins (Bloomer & Crowe 1998).

2019.1
Jackson’s Francolin *Pternistis jacksoni* avibase-A7E59764

1:1 →

2026.0
Jackson's Spurfowl *Pternistis jacksoni* avibase-A7E59764

2019.1
Hildebrandt's Francolin *Pternistis hildebrandti* avibase-F5A73AAA

1:1 →

2026.0
Hildebrandt's Spurfowl *Pternistis hildebrandti* avibase-F5A73AAA

2019.1
Scaly Francolin *Pternistis squamatus* avibase-1B11690B

1:1 →

2026.0
Scaly Spurfowl *Pternistis squamatus* avibase-1B11690B

Musophagiformes

Turacos Musophagidae

2019.1
Bare-faced Go-away-bird *Corythaixoides personatus* avibase-215428B0
Bare-faced (Brown-faced) Go-away-bird *Corythaixoides personatus personatus* avibase-71A552DA
Bare-faced (Black-faced) Go-away-bird *Corythaixoides (personatus) leopoldi* avibase-BEDA5DA6

n:1 →

2026.0
Bare-faced Go-away-bird *Crinifer personatus* avibase-215428B0

AviList taxonomy decision

Taxon leopoldi (monotypic) is treated as a subspecies of Crinifer personatus, as plumage differences are modest and variable within each taxon, and no behavioral or ecological differences have been identified; genetic data would be informative.

2019.1
White-bellied Go-away-bird *Criniferoides leucogaster* avibase-2AA4BC58

1:1 →

2026.0
White-bellied Go-away-bird *Crinifer leucogaster* avibase-2AA4BC58

AviList taxonomy decision

Corythaixoides and Criniferoides are placed in the genus Crinifer based on a combination of nuclear and mitochondrial DNA data (Veron & Winney 2000; Njabo & Sorenson 2009; Perktaş et al. 2020).

2019.1
Eastern Grey Plantain-eater *Crinifer zonurus* avibase-10B14696

1:1 →

2026.0
Eastern Plantain-eater *Crinifer zonurus* avibase-10B14696

AviList taxonomy decision

Corythaixoides and Criniferoides are placed in the genus Crinifer based on a combination of nuclear and mitochondrial DNA data (Veron & Winney 2000; Njabo & Sorenson 2009; Perktaş et al. 2020).

2019.1
Ross's Turaco *Musophaga rossae* avibase-2C7BA3A6

1:1 →

2026.0
Ross's Turaco *Tauraco rossae* avibase-2C7BA3A6

Otidiformes

Bustards Otididae

2019.1
Denham’s Bustard *Ardeotis denhami* avibase-4FDBC0CB

1:1 →

2026.0
Denham's Bustard *Neotis denhami* avibase-4FDBC0CB

2019.1
Heuglin’s Bustard *Ardeotis heuglinii* avibase-4971D1EF

1:1 →

2026.0
Heuglin's Bustard *Neotis heuglinii* avibase-4971D1EF

Cuculiformes

Cuckoos Cuculidae

2019.1
White-browed Coucal *Centropus superciliosus* avibase-BD2BC35C

1:1 →

2026.0
White-browed Coucal *Centropus superciliosus* avibase-4B2A7A35

AviList taxonomy decision

Taxon burchellii (polytypic, including fasciipygialis) is treated as a species separate from Centropus superciliosus based on plumage differences, supported by limited hybridization in areas of contact (Harrison et al. 1997). However, ecological and vocal differences have not been documented, suggesting further research is warranted.

2019.1		2026.0
Southern Yellowbill (Green Malkoha) *Ceuthmochares australis* avibase-3A46A20C	1:1 →	**Green Malkoha** *Ceuthmochares australis* avibase-3A46A20C

2019.1		2026.0
Western Yellowbill (Blue Malkoha) *Ceuthmochares aereus* avibase-E0D521B7	1:1 →	**Blue Malkoha** *Ceuthmochares aereus* avibase-E0D521B7

Columbiformes

Doves and Pigeons Columbidae

2019.1		2026.0
None listed	New →	**Vinaceous Dove** *Streptopelia vinacea* avibase-DDEF7228

2019.1		2026.0
African Mourning Dove *Streptopelia decipiens* avibase-70BD722B	1:1 →	**Mourning Collared Dove** *Streptopelia decipiens* avibase-70BD722B

2019.1		2026.0
African White-winged Dove *Streptopelia reichenowi* avibase-65FE8029	1:1 →	**White-winged Collared Dove** *Streptopelia reichenowi* avibase-65FE8029

2019.1		2026.0
Feral Pigeon *Columba livia* avibase-BBA263C2	1:1 →	**Rock Dove** *Columba livia* avibase-BBA263C2

2019.1		2026.0
Blue-spotted Wood-Dove *Turtur afer* avibase-23D5FC36	1:1 →	**Blue-spotted Wood Dove** *Turtur afer* avibase-23D5FC36

2019.1		2026.0
Emerald-spotted Wood-Dove *Turtur chalcospilos* avibase-BDF442F2	1:1 →	**Emerald-spotted Wood Dove** *Turtur chalcospilos* avibase-BDF442F2

Gruiformes

Cranes Gruidae

2019.1		2026.0
Demoiselle Crane *Anthropoides virgo* avibase-64DDD14D	1:1 →	**Demoiselle Crane** *Grus virgo* avibase-64DDD14D

AviList taxonomy decision

Anthropoides (polytypic) and Bugeranus (monotypic) are placed in the genus Grus based on available evidence. Analysis of complete mitochondrial genomes (Krajewski et al. 2010), and multilocus DNA data (Fain et al. 2007) failed to resolve basal relationships among these genera, indicating that they are best retained in an expanded Grus pending further research.

Rails, Gallinules, and Coots Rallidae

2019.1
African Water Rail *Rallus caerulescens* avibase-5B443EDE

1:1
→

2026.0
African Rail *Rallus caerulescens* avibase-5B443EDE

2019.1
African Crake *Crex egregia* avibase-09A0F2EB

1:1
→

2026.0
African Crake *Crecopsis egregia* avibase-09A0F2EB

AviList taxonomy decision

Taxon egregia is placed in the monotypic genus Crecopsis based on nuclear and genomic DNA evidence of non-monophyly with Crex crex (Garcia-R et al. 2020; Kirchman et al. 2021).

2019.1
Corncrake *Crex crex* avibase-7E257242

1:1
→

2026.0
Corn Crake *Crex crex* avibase-7E257242

2019.1
Lesser Moorhen *Gallinula angulata* avibase-A927C1AE

1:1
→

2026.0
Lesser Moorhen *Paragallinula angulata* avibase-A927C1AE

2019.1
Purple Swamphen *Porphyrio porphyrio (race madagascariensis)* avibase-865C039E

1:1
→

2026.0
Purple Swamphen *Porphyrio porphyrio* avibase-AC1E791E

AviList taxonomy decision

The Porphyrio porphyrio complex is treated as a single polytypic species pending further research. Sometimes treated as six species based largely on mitochondrial-dominated DNA data (Sangster 1998; Garcia-R & Trewick 2015; Verry et al. 2023) that indicate deep divergences and paraphyly with respect to the two species of takahe, P. mantelli and P. hochstetteri. Available nuclear DNA data (Garcia-R & Trewick 2015) are mostly uninformative and mtDNA divergence times may be over-estimated. Further research incorporating denser sampling of nuclear DNA will be needed to determine species limits in this complex.

2019.1
Striped Crake *Amaurornis marginalis* avibase-13967506

1:1
→

2026.0
Striped Crake *Aenigmatolimnas marginalis* avibase-13967506

AviList taxonomy decision

Taxon marginalis is placed in the genus Aenigmatolimnas based on nuclear (Garcia-R et al. 2020) and genomic DNA (Kirchman et al. 2021) evidence. Formerly placed in Amaurornis, deep divergence combined with differences in morphology, ecology, and biogeography indicate that marginalis is best treated as a monotypic genus.

Charadriiformes

Thick-knees and Stone-curlews Burhinidae

2019.1
Stone-curlew *Burhinus oedicnemus* avibase-C7DB323E

1:1
→

2026.0
Eurasian Stone-curlew *Burhinus oedicnemus* avibase-C7DB323E

Plovers and Lapwings Charadriidae

2019.1
Three-banded Plover *Charadrius tricollaris* avibase-8DAF86A1

1:1
→

2026.0
Three-banded Plover *Thinornis tricollaris* avibase-8DAF86A1

AviList taxonomy decision

Taxon bifrontatus is treated as a subspecies of Thinornis tricollaris based on available evidence. Although the two taxa differ in plumage and mitochondrial DNA (Dos Remedios et al. 2020) the levels are more consistent with subspecific differentiation. A more comprehensive analysis based on genomic DNA may be informative.

2019.1		2026.0
Little Ringed Plover *Charadrius dubius* avibase-35EC3BBF	1:1 →	**Little Ringed Plover** *Thinornis dubius* avibase-35EC3BBF

avibase-214B3533

1:1 →

2026.0
White-fronted Plover *Anarhynchus marginatus*
avibase-214B3533

2019.1
Kentish Plover *Charadrius alexandrinus* avibase-AA4385A2

1:1 →

2026.0
Kentish Plover *Anarhynchus alexandrinus* avibase-AA4385A2

AviList taxonomy decision

Taxon seebohmi is treated as a subspecies of Anarhynchus alexandrinus, as the evidentiary basis for a split is weak. Vocal differences between seebohmi and alexandrinus have not been documented; there are only minor morphometric differences between the two (Niroshan et al. 2023), for which clinal variation has not been ruled out; mitochondrial DNA divergence is negligible, and there is no support for seebohmi as the earliest-diverged lineage in this complex (Niroshan et al. 2023).

Sandpipers and Allies Scolopacidae

2019.1
Whimbrel *Numenius phaeopus* avibase-F9305BAA

1:1 →

2026.0
Eurasian Whimbrel *Numenius phaeopus*
avibase-082F3A63

AviList taxonomy decision

Taxon hudsonicus (polytypic, including rufiventris) is treated as a species separate from Numenius phaeopus based on morphology and deep genomic DNA divergence (McLaughlin et al. 2020; Tan et al. 2023). However, vocalizations seem similar, and a formal bioacoustic analysis is lacking.

2019.1

1:1 →

2026.0
Western Reef Heron *Egretta gularis* avibase-DF32B1F9

AviList taxonomy decision

Taxon dimorpha is treated as a subspecies of Egretta garzetta (polytypic, including Australasian immaculata) based on available evidence. Sometimes split as a separate species, or treated as a subspecies of gularis, based largely on the presence of a dark morph, the bare parts color and bill form suggest that dimorpha is better treated as a subspecies of E. garzetta. Furthermore, the name nigripes is considered invalid (nigripes=immaculata) as some syntypes appear to be of hybrid origin, and phenotypic intermediacy suggests widespread intergradation between garzetta and immaculata in the Sundaic region.

2019.1

Striated Heron *Butorides striata* avibase-36DF115B

1:1 →

2026.0
Little Heron *Butorides atricapilla* avibase-7085B8A0

AviList taxonomy decision

Four species are recognized in the Butorides striata complex based on the genomic DNA evidence of Mendales (2023): monotypic B. sundevalli from Galapagos; polytypic B. virescens from North America; monotypic B. striata from South America; and a polytypic Old World B. atricapilla group. While further splits in the B. atricapilla group may be warranted, genetic sampling was too geographically limited to properly assess these; further research needed.

Fiery-necked Nightjar *Caprimulgus pectoralis* avibase-62ED1974
Black-shouldered Nightjar *Caprimulgus (pectoralis) nigriscapularis* avibase-AB8E1D95

n:1 →

2026.0
Fiery-necked Nightjar *Caprimulgus pectoralis* avibase-7E3578A2

AviList taxonomy decision

Taxon nigriscapularis is treated as a subspecies of Caprimulgus pectoralis due to overlap in vocalizations (Dowsett & Dowsett-Lemaire 1993) and morphometrics (Jackson 2013), and minimal plumage differences (Louette 1990). Limited genetic data confirm monophyly of this group, with nigriscapularis as the most divergent lineage (Han et al. 2010); due to limited genomic sampling and potential mitochondrial DNA introgression, further genetic studies are desirable.

2019.1

2019.1
Barn Owl *Tyto alba* avibase-FEE35F4C

1:1 →

2026.0
Western Barn Owl *Tyto alba* avibase-CFD6F275

AviList taxonomy decision

Tyto alba sensu lato is split into three polytypic species (T. furcata, T. javanica, and T. alba) based on genetics (Aliabadian et al. 2016; Uva et al. 2018) and vocalizations (Robb 2015). Mitochondrial-dominated DNA data (Uva et al. 2018) also placed T. glaucops within the furcata group, while T. nigrobrunnea and T. rosenbergii resolved as part of the javanica group; genomic data are needed to better understand species relationships in this complex.

n:1 →

2026.0
Black Kite *Milvus migrans* avibase-06D9A2C8

AviList taxonomy decision

Taxon aegyptius (polytypic, including parasitus) is treated as conspecific with Milvus migrans pending further research. Although the aegyptius complex is morphologically distinctive, mitochondrial DNA data (Johnson et al. 2005; Andreyenkova et al. 2021) do not recover the group as monophyletic, and geographic patterns do not align with currently recognized subspecies. All taxa are retained within a single species until more comprehensive nuclear or genomic data are available.

n:1 →

2026.0
Common Buzzard *Buteo buteo* avibase-3C0C325D

AviList taxonomy decision

Taxon bannermani (monotypic) is treated as a subspecies of Buteo buteo (polytypic) based on available evidence. Size-related characters clearly align bannermani with B. buteo, but plumage characters are highly variable and largely uninformative (Kruckenhauser et al. 2004). Conversely, limited mitochondrial DNA data align bannermani with B. rufinus (Clouet & Wink 2000; Kruckenhauser et al. 2004) and there is evidence of genetic introgression within B. buteo and related species (Jowers et al. 2019); further research needed.

1:1 →

2026.0
Northern Red-billed Hornbill *Tockus erythrorhynchus* avibase-AF75AC32

AviList taxonomy decision

Five species are recognized in the Tockus erythrorhynchus complex based on a combination of plumage, bare parts color, vocalizations, genetics (Kemp & Delport 2002; Viseshakul et al. 2011; Gonzalez et al. 2013), and hybrid zone dynamics (Delport et al. 2004): T. erythrorhynchus; T. ruahae; T. kempi; T. rufirostris; and T. damarensis. Mitochondrial DNA data (Gonzalez et al. 2013) suggested that these may divide into two groups: northern erythrorhynchus, kempi, and ruahae and southern rufirostris and damarensis. Further research is needed in areas of parapatry to assess levels of gene flow and a more comprehensive genetic review would be informative.

avibase-75DF194C

1:1 →

2026.0
Eastern Yellow-billed Barbet *Trachylaemus purpuratus* avibase-80BC978E

AviList taxonomy decision

Taxon goffinii (polytypic, including togoensis) is treated as a species separate from Trachylaemus purpuratus based on plumage, facial bare parts color, and genetics. Deep mitochondrial DNA divergence (Moyle 2004) supports recognition of an eastern (purpuratus) and western clade but it is unclear if the western sample represented goffinii or togoensis. Pending further genetic research incorporating broader taxon sampling, togoensis is treated as a subspecies of T. goffinii.

avibase-55E9B668

n:1 →

2026.0
D'Arnaud's Barbet *Trachyphonus darnaudii*
avibase-1953C1D6

AviList taxonomy decision

Trachyphonus darnaudii is treated as a single polytypic species based on available evidence. Taxa usambiro and emini sometimes treated as separate species but plumage and morphological differences are relatively modest. Furthermore, although usambiro is vocally distinct, and possibly allopatric, behavioral responses led Short & Horne (1985a) to recognize a single species in this complex. Mitochondrial DNA data are limited (Barker & Lanyon 2000; Moyle 2004; Brown et al. 2008) and a more thorough analysis of morphology, vocalizations and genetics would be informative.

1:1 →

2026.0
Grey-throated Barbet *Gymnobucco bonapartei* avibase-95054CA5

AviList taxonomy decision

Taxon cinereiceps (monotypic) is treated as a subspecies of Gymnobucco bonapartei, as the evidentiary basis for a split is weak. The distributions of bonapartei and cinereiceps appear to be continuous, with a cline of increasing size eastwards, and a broad hybrid zone. Although differences in iris color occur (Chapin 1939) there is no evidence of behavioral, ecological, or genetic differences to support species status.

n:1 →

2026.0
Yellow-rumped Tinkerbird *Pogoniulus bilineatus* avibase-7749C92B

AviList taxonomy decision

Taxon makawai is treated as a synonym of Pogoniulus bilineatus based on analysis of mitochondrial and nuclear DNA (Kirschel et al. 2018). Although plumage differences are striking, the single specimen of makawai is embedded within P. bilineatus suggesting that it is an aberrant color-morph; field observations have also failed to locate additional individuals of makawai (Dowsett et al. 2008).

2019.1
Red-fronted Tinkerbird *Pogoniulus pusillus* avibase-A4CF3B9E

1:1 →

2026.0
Northern Red-fronted Tinkerbird *Pogoniulus uropygialis* avibase-E01F4BD7

AviList taxonomy decision

Taxon uropygialis (polytypic, including affinis) is treated as a species separate from Pogoniulus pusillus based on Kirschel et al. (2021).

n:1 →

2026.0
White-headed Barbet *Lybius leucocephalus* avibase-BCA0F974

AviList taxonomy decision

The monotypic taxa leucogaster and senex are treated as subspecies of Lybius leucocephalus based on available evidence. Although sometimes split as separate species, plumage differences seem modest, ecologically the taxa are similar, and subspecies senex and albicauda are reported to interbreed (Short & Horne 1985a). Further evidence may show that the geographically isolated subspecies leucogaster warrants separation; further research needed.

Honeyguides Indicatoridae

2019.1
Wahlberg's Honeybird *Prodotiscus regulus* avibase-8DB3F1A2

1:1 →

Thick-billed Honeyguide *Iindicator (minor) conirostris* avibase-0AC6CF82

n:1 →

2026.0
Lesser Honeyguide *Indicator minor* avibase-50F3668C

AviList taxonomy decision

Taxon conirostris (polytypic, including ussheri) is treated as conspecific with Indicator minor based on the lack of clear-cut ecological, vocal, and plumage differences. Vocalizations appear to be indistinguishable (Short & Horne 1985b), reports of sympatric breeding (Friedmann 1969) have not been substantiated, and genetic data (Sonet et al. 2011) are uninformative; further research needed.

Woodpeckers Picidae

2019.1

1:1 →

2026.0
Fine-banded Woodpecker *Campethera taeniolaema* avibase-D0A5FADB

AviList taxonomy decision

Taxon taeniolaema (polytypic, including hausburgi) is treated as a species separate from Campethera tullbergi based on pronounced differences in underparts plumage, supported by divergence in nuclear and mitochondrial DNA (Fuchs et al. 2017a). Vocalizations are poorly known and a formal bioacoustic analysis may be informative.

2019.1
Green-backed Woodpecker *Campethera cailliautii* avibase-BD7C4F70

1:1 →

2026.0
Green-backed Woodpecker *Campethera maculosa* avibase-BD7C4F70

AviList taxonomy decision

Taxa permista and cailliautii (polytypic) are treated as conspecific with Campethera maculosa based on available evidence. Sometimes treated as two or three species based on plumage, taxon permista is only weakly differentiated from maculosa and hybridizes with the phenotypically distinctive cailliautii (Chapin 1952; Prigogine 1987). Divergence in nuclear and mitochondrial DNA (Fuchs et al. 2017a) is modest, and vocalizations of all seem similar, suggesting they are best treated as conspecific pending further research.

n:1 →

2026.0
Common Kestrel *Falco tinnunculus* avibase-2DAB45B8

AviList taxonomy decision

Taxon rupicolus is split from Falco tinnunculus based on genetics (Groombridge et al. 2002; Fuchs et al. 2015) and plumage. Inclusion of rupicolus in F. tinnunculus renders that species polyphyletic based on nuclear and mitochondrial DNA (Fuchs et al. 2015). Taxon rupicolus also shows reduced sexual dichromatism compared to most subspecies, but additional genetic research is needed to resolve the status of other forms within the F. tinnunculus complex, particularly neglectus and alexandri.

2019.1
Red-necked Falcon *Falco chiquera* avibase-6A64EFCB

1:1 →

2026.0
Red-necked Falcon *Falco chicquera* avibase-6A64EFCB

AviList taxonomy decision

The African taxa ruficollis and horsbrughi sometimes are split from Asian nominate Falco chicquera (e.g., del Hoyo & Collar 2014) but the evidentiary basis for a split is considered weak. Differences in plumage are relatively minor and mitochondrial DNA data (Wink & Sauer-Gürth 2000, 2004) are more consistent with subspecies level divergence. Documentation of ecological differences and genomic data might add greater perspective to this proposed split.

1:1 →

2026.0
Yellow-bellied Wattle-eye *Platysteira concreta* avibase-3B66D504

AviList taxonomy decision

Taxon ansorgei is retained as a subspecies of Platysteira concreta pending further investigation. Considerable variation in plumage (Harris & Franklin 2000) occurs within P. concreta sensu lato, but a more comprehensive analysis of behavior and vocalizations is required. While mitochondrial DNA analyses have identified some deep divergences within the complex (Njabo et al. 2008; Fuchs et al. 2004; Erard et al. 2019), taxon sampling is incomplete, making any splits premature.

2019.1
Forest Batis *Batis mixta* avibase-D91540DE

1:1 →

2026.0
Short-tailed Batis *Batis mixta* avibase-D91540DE

AviList taxonomy decision

Taxon reichenowi is retained as a subspecies of Batis mixta based on genetic evidence and reassessment of plumages following Fjeldså et al. (2006). Plumages within this complex are variable and mitochondrial DNA data showed reichenowi nested within B. mixta; genomic and vocal evidence would be needed to justify a split.

1:1 →

2026.0
Sharpe's Drongo *Dicrurus sharpei* avibase-84249EE3

AviList taxonomy decision

Taxon sharpei (polytypic, including occidentalis) is treated as a species separate from Dicrurus ludwigii based on analysis of plumage, proportions, and vocalizations (Fishpool et al. 2021), and genetics. Mitochondrial DNA data (Fuchs et al. 2017b, 2018b) do not recover D. ludwigii sensu lato as monophyletic, with sharpei being more closely aligned to D. atripennis. Although a relatively deep mtDNA divergence separates sharpei and occidentalis (Fuchs et al. 2018b) they are treated as conspecific pending further research.

2019.1
Fork-tailed (Common) Drongo *Dicrurus adsimilis* avibase-11FE7313
Glossy-backed (Northern) Drongo *Dicrurus divaricatus* avibase-7763FEC8

n:1 →

2026.0
Fork-tailed Drongo *Dicrurus adsimilis* avibase-11FE7313

AviList taxonomy decision

Taxon divaricatus (polytypic, including lugubris) is treated as conspecific with Dicrurus adsimilis based on available evidence. Phenotypic differences are not pronounced (shade of plumage gloss, and length of wing and tail fork), and nuclear DNA data (Fuchs et al. 2018a) recover them as monophyletic. Earlier suggestions of non-monophyly based on a short section of mitochondrial DNA (Fuchs et al. 2017b) appear to be the result of mitochondrial DNA capture in divaricatus west of Lake Chad.

1:1 →

2026.0
Bleating Camaroptera *Camaroptera brachyura* avibase-DC456636

AviList taxonomy decision

The polytypic brevicaudata group is retained in Camaroptera brachyura based on present evidence. Sometimes split based on plumage and habitat differences, the grey-backed brevicaudata group and green-backed brachyura group are vocally similar (Dowsett & Dowsett-Lemaire 1980), and hybridize in areas of contact (White 1962; Zimmerman et al. 2001). Available mitochondrial DNA data (Nguembock et al. 2007) identified deep divergences between brevicaudata, harterti, and brachyura, but further research is needed to define species limits in this group.

Eurasian Reed Warbler *Acrocephalus scirpaceus* avibase-3F0EE474

n:1 →

2026.0
Common Reed Warbler *Acrocephalus scirpaceus* avibase-3F0EE474

AviList taxonomy decision

Taxon baeticatus (polytypic) is treated as conspecific with Acrocephalus scirpaceus (polytypic) based on relatively low differentiation in vocalizations (Dowsett-Lemaire & Dowsett 1987), morphology, and genetics (Olsson et al. 2016; Pavia et al. 2018) across the geographic range of this complex. Furthermore, mitochondrial DNA data (Olsson et al. 2016) do not provide strong support for a two-species treatment; further research warranted.

2026.0
African Red-rumped Swallow *Cecropis melanocrissus* avibase-91315CD4
European Red-rumped Swallow *Cecropis rufula*
avibase-B4967714

AviList taxonomy decision

Five species are recognized in the Cecropis daurica complex based on a combination of plumage, vocalizations, and evidence from mitochondrial (Sheldon et al. 2005) and genomic DNA data (Brown 2019; Schield et al. 2024): monotypic C. hyperythra based on plumage and vocalizations; monotypic C. badia based on plumage, size, and parapatry with populations of daurica; polytypic C. daurica involving a merger of most populations of temperate-migratory daurica and tropical Asian striolata based on clinality in plumage and genetic paraphyly; monotypic C. rufula based on plumage, genetics, and a zone of parapatry with populations of C. daurica; and polytypic C. melanocrissus based on plumage and genetics. A comprehensive review of this complex integrating formal bioacoustic analyses, broad genomic sampling, and phenotypic variation, is desirable.

2026.0
Kikuyu Mountain Greenbul *Arizelocichla kikuyuensis* avibase-1EEE86B8
Black-headed Mountain Greenbul *Arizelocichla nigriceps* avibase-FC523946

AviList taxonomy decision

Taxon kikuyuensis is treated as a species separate from Arizelocichla nigriceps based on plumage, vocalizations, and genetics. Although plumage differences are obvious, information from mitochondrial DNA (Shakya & Sheldon 2017; De Santis et al. 2018) is restricted to short fragments, and formal bioacoustic analyses are lacking; further research would be informative.

2019.1
Stripe-cheeked Greenbul *Arizelocichla milanjensis* avibase-4996833A

1:1 →

2026.0
Olive-headed Greenbul *Arizelocichla striifacies* avibase-9A80B57C

AviList taxonomy decision

Taxon striifacies (polytypic, including olivaceiceps) is treated as a species separate from Arizelocichla milanjensis based on available evidence. Sometimes split into 3 species (A. milanjensis, A. striifacies and A. olivaceiceps) but plumage differences support a 2-species treatment with milanjensis, the most distinctive taxon, separated at the species level. Genetic data are fragmentary but mitochondrial DNA (Shakya & Sheldon 2017) supports separation of striifacies from milanjensis. Nevertheless, a comprehensive genetic study and investigation of contact zones is needed to confirm species limits in this group.

2019.1
Yellow-throated Greenbul (Leaflove) *Atimastillas flavicollis* avibase-C73137EA

1:1 →

2026.0
Pale-throated Greenbul *Atimastillas flavigula* avibase-04E77EEF

AviList taxonomy decision

Taxon flavigula (polytypic, including soror) is treated as a species separate from Atimastillas flavicollis based on plumage and vocalizations. Although plumages are geographically variable they show an abrupt transition, with an apparent lack of intergradation, where their ranges approach. Available genetic data are fragmentary (Moyle & Marks 2006; Johansson et al. 2007; Fregin et al. 2012a) and comparative data lacking; further research needed.

1:1 →

2026.0
Red-billed Oxpecker *Buphagus erythroryncha*
avibase-7471E71D

AviList taxonomy decision

The original spelling was Tanagra erythroryncha, but the species was soon moved into the genus Buphagus, and many modern sources have emended the original spelling to "erythrorhynchus" (with an -rh). In 2023, by some measures, the usage of the -rh spelling was roughly an order of magnitude higher than the usage of the original -r spelling, but by other measures, it was only ~4 times higher, which is not considered as a prevailing usage by most practitioners, hence arguing in favor of the retention of the original -r spelling. Additionally, erythroryncha is not an adjective but a poorly formed noun, and its ending can therefore not be adjusted according to the gender of the genus. Therefore, the original spelling "erythroryncha" is retained.

2026.0
Yellow-breasted Forest Robin *Stiphrornis mabirae*
avibase-2455B82B

AviList taxonomy decision

Taxa pyrrholaemus (monotypic) and mabirae (polytypic, including sanghensis) are treated as species separate from Stiphrornis erythrothorax (polytypic, including gabonensis, dahomeyensis, inexpectatus, and xanthogaster) based on plumage and genetics (Beresford & Cracraft 1999; Schmidt et al. 2008; Voelker et al. 2013, 2017). Sometimes treated as five species, mitochondrial-dominated DNA data have revealed three deeply diverged lineages within this complex (Voelker et al. 2017) consistent with a 3-species treatment. Further bioacoustic and genetic research is needed to better define distributional and taxonomic limits within this complex.

2026.0
Siberian Stonechat *Saxicola maurus* avibase-3380CFC5

AviList taxonomy decision

2025-0171)) Taxon stejnegeri is treated as conspecific with Saxicola maurus pending further research. Although mitochondrial DNA data (Zink et al. 2009; Illera et al. 2008) indicate the presence of deep divergences within the Asian stonechats, not all taxa have been sampled. Furthermore, unsampled taxa have senior scientific names and may be closely related to stejnegeri; consequently, the split of stejnegeri is considered premature; genomic data required. 2025-0172)) Saxicola torquatus is treated as three species based on available evidence: S. maurus (Asian stonechats, polytypic); S. torquatus (African stonechats, polytypic); and S. rubicola (European stonechats, polytypic). Genomic (Van Doren et al. 2017) and mitochondrial DNA data (Zink et al. 2009; Illera et al. 2008) do not recover S. torquatus sensu lato as monophyletic, with S. dacotiae embedded within it. A more comprehensive taxonomic review of this complex is required given the ecological and phenotypic similarities among these species.

1:1 →

2026.0
Heuglin's Wheatear *Oenanthe heuglinii* avibase-6ADB636C

AviList taxonomy decision

2025-0161)) Taxon frenata is treated as a monotypic species separate from Oenanthe bottae (monotypic) based on modest plumage differences. Forming a complex with O. heuglinii and O. isabellina (Zhao et al. 2023), plumage differences among African species are relatively weak and mitochondrial DNA divergence is modest (Zhao et al. 2023). Although genetic data for O. bottae are lacking, its plumage is considered the most distinct, prompting recognition of frenata as a separate species. Further research is needed and may result in a taxonomic revision of this complex. 2025-N030)) The earliest mention of the name has the spelling heuglinii, attributed to a work by von Heuglin (1869: 346-7), wherein the latter author credited Hartlaub & Finsch for the description.

Gosling's Bunting *Emberiza goslingi* avibase-17E7F90B

AviList taxonomy decision

Taxon septemstriata is treated as conspecific with Emberiza tahapisi, although its status as a valid taxon remains unresolved. The single specimen included in the genetic study of Olsson et al. (2013b) had the plumage of tahapisi but the mitochondrial DNA of E. goslingi; further research needed.
